

DATASHEET CONTINUOUS CUP BUCKET ELEVATORS

Continuous Cup bucket elevators are designed to handle friable, fragile materials to minimize product degradation or damage. They are also ideal for handling sluggish or abrasive materials. Continuous Cup bucket elevators are also used to convey light, free-flowing matter where aeration of the material must be avoided.

Material is fed into the buckets from an inlet chute. Buckets are designed for gentle discharge; the buckets are closely spaced on the belt or chain to allow the material to flow over the backside of the preceding bucket, whose extended sides form a chute to guide the material into the discharge spout. Direct loading of the material, combined with the slow speed of this elevator type, avoids the "throwing" action associated with centrifugal style elevators, making it ideal for use with fragile materials.
